

THE AUTO-DYNAMIC CIERVA AUTOGIRO

The recent demonstrations of the Direct Take-off type of Cierva Autogiro have startled the aviation world, and the astonishing performance of the machines has been heralded as the dawn of a new era in aviation.

It is perhaps only natural that Timken tapered roller bearings with their high capacity-weight ratio, and their ability to withstand simultaneously applied radial and thrust loads, should have

been selected for the vital points, the rotor blade pivots, where they operate under high loading with complete dependability.
